Ignition timing makes torque, and torque makes power! At very low loads at barely part throttle most engines typically need 15 degrees of timing more than MBT at WOT for that given rpm. So for example, if you MBT out at 35 degrees at 3k rpm, then for maximum efficiency you should be around 50 degrees during very light throttle at 3k rpm.

The Toyota K series is an inline-four engine that was produced from 1966 through 2007. It is a two-valve pushrod engine design, a rarity for the company. It was originally built from the Toyota Kamigo plant in Toyota City factory in Japan.. All K series are non-crossflow engines - the inlet and exhaust manifolds are on the same side. They have cast iron blocks and aluminium alloy heads, with ...

When in doubt, total timing should be somewhere between 34 and 36 degrees. A typical small-block Chevy's timing curve needs to be set somewhere in this range for maximum performance, when the engine is being revved at 3500 RPM. At this point, the timing should stop advancing and should remain steady.
