Introduction. An air brake is a panel conforming the shape of an aircraft that can be opened with hydraulic pressure in order to create drag, similar to spoilers which are on the edges of the aircraft wings and open in an upward position forcing the plane towards the ground. Air brakes are used when the aircraft needs to reduce its airspeed, while spoilers are only able to be opened when the ...

4.) With the introduction of spring brakes, anti-compounding and 121 air brake systems, because a valve is leaking air out of its exhaust, does not mean the valve is at fault. If a spring brake is leaking from the the spring brake to the service brake side, that air will travel back up the service line and out the exhaust of the next valve back.

AIR BRAKE SYSTEM TROUBLESHOOTING

That means when the brake pedal is depressed, air brakes function by releasing air from the system and allowing the spring to push the mechanism back into a stopping position. Likewise, whenever the operator lets off the brake pedal in an air brake-controlled vehicle, air pressure builds again and pushes the braking mechanism back out of the way.
