ASELS describes the safe and reliable life scope for aircraft structures in service. It reflects the interrelationships between stress level (S , in MPa), fatigue life (N_f , in flight hours), and calendar life (N_y , in years). When an aircraft is used so heavily that it exceeds the limits of ASELS, the structural state is considered to be unsafe.

Aircraft Structure - an overview | ScienceDirect Topics

The weight of the aircraft is the common factor that links all aspects of aircraft design such as aerodynamics, structure, and propulsion, all together. An aircraft's weight is derived from various factors such as empty weight, payload, useful load, etc. The various weights are used to then calculate the center of mass of the entire aircraft.
