MAIN IDEA: Cells go through two rounds of division in meiosis. 1. After a chromosome is replicated, each half is called a . 2. Two chromosomes that are very similar and carry the same genes are called. In the space below, sketch the phases of meiosis I and II and write the name of each phase below it. Use Figure 6.5 to help you. 3. 4. 5. 6. 7. 8. 9. 10. Meiosis I Meiosis II

Biology Section 11-4 Meiosis Worksheet Answer Key

Meiosis is a form of nuclear division that reduces chromosome number from diploid to haploid. Each haploid cell produced by meiosis has 22 autosomes and 1 sex chromosome. 1. How do gametes differ from somatic cells? 2. The prefix homo-means "the same." Explain how this meaning relates to the definition of homologous chromosomes. 3.

Meiosis is a two-part cell division process in organisms that sexually reproduce. Meiosis produces gametes with one half the number of chromosomes as the parent cell. In some respects, meiosis is very similar to the process of mitosis, yet it is also fundamentally different from mitosis. The two stages of meiosis are meiosis I and meiosis II.

Meiosis is a type of cell division in sexually reproducing organisms consisting of two rounds of cell division but only one round of DNA replication, resulting in daughter cells with half the number of chromosome sets as the mother cell. Meiosis produces gametes and enhances genetic variability. 17. Meiosis always begins with cells that...

Chapter 13: Meiosis and Sexual Life Cycles

In meiosis I, the offspring cells are haploid but each cell contains two copies of the chromosome because the original cell copied its DNA before meiosis I. The offspring cells of meiosis II are also haploid, but each cell contains only one copy of the chromosome because, unlike meiosis I, the cells do not copy their DNA before meiosis II. 4.
