Prestressed concrete decks are commonly used for bridges with spans between 25m and 450m and provide economic, durable and aesthetic solutions in most situations where bridges are needed. Concrete remains the most common material for bridge construction around the world, and prestressed concrete is frequently the material of choice.

His research interests include structural concrete and masonry, behavior and design of prestressed, concrete and masonry structures, fiber-reinforced polymer (FRP) composites, use of FRP composites to repair and strengthen concrete and masonry structures, durability and evaluation of existing bridge and building structures, and evaluate effect of environment on the structural integrity of bridge and building structures.

Prestressed Concrete: Building, Design, and Construction ...
Prestressed concrete is a form of concrete used in construction. It is substantially "prestressed" during production, in a manner that strengthens it against tensile forces which will exist when in service.–5 This compression is produced by the tensioning of high-strength "tendons" located within or adjacent to the concrete and is done to improve the performance of the concrete in service. Tendons may consist of single wires, multi-wire strands or threaded bars that are most commonly made ...

Prestressed concrete - Wikipedia
Prestressed concrete refers to concrete that has applied stressesinduced into the member. Typically, wires or "tendons" are stretched and then blocked at the ends creating compressive stresses throughout the member's entire cross- section. Most Prestressed concrete is precast in a plant.

Prestressed concrete can be designed avoiding the tensile cracks in the concrete. Then the whole section will be in compression and there are no tensile caracks. It increases the durability of the structure. The load-carrying capacity is comparatively higher.

Philadelphia's Walnut Lane Bridge, completed in late 1950, is considered the first major prestressed-concrete bridge in the U.S. Gustave Magnel, a Belgian engineer, and Charles Zollman, Magnel's student, designed the bridge. Each of the post-tensioned concrete beams was cast at the bridge site in a single piece.
