Engine Cylinder Deactivation

In a nutshell, cylinder deactivation is simply keeping the intake and exhaust valves closed through all cycles for a particular set of cylinders in the engine. Depending on the design of the engine, valve actuation is controlled by one of two common methods:

Cylinder Deactivation & Variable Engine Displacement

Deactivation is mostly used on V6 or V8 engines, where, in principle, it reduces the engine's displacement when it functions: Bigger-engine power when all cylinders are activated, and...

How It Works: Cylinder deactivation | Driving

Cylinder Deactivation, or CDA, is a technique in multi-cylinder engines where a combination of cylinders are systematically disabled, effectively reducing the engine's displacement, improving overall engine efficiency and fuel economy. CDA is achieved by deactivating the intake and exhaust valves for the deactivated cylinder.

Except for Honda's V-6 engine, most cylinder deactivation is applied to domestically-built truck V-8 engines, though various GM V-6 engines also are benefitting from the technology. Still, the systems don't get nearly as much attention as some other methods of boosting fuel economy. Start/Stop operation

Cylinder Deactivation: How It Can Save Fuel | Shopping ...

Cylinder deactivation provides owners with the best of both worlds – V8 power when it's needed, and four-cylinder fuel economy and emissions levels when it's not. Typically, when a cylinder is deactivated, the system closes its intake and exhaust valves. It also stops injecting fuel into the deactivated cylinder.

Deactivating a single cylinder reduces engine torque generated, Other 3 injectors have to compensate for the torque loss, this affects Injector balance. Continue Reading. It Does have an adverse effect on the engine life, in the following ways. An engine designed and balanced for 4 cylinders will have poor balancing with 3 cylinders.

Does cylinder deactivation affect engine life? - Quora

There is no way to deactivate it as far as I know. The turbo model does not have it but then you are swapping one complication for another. The key is regular oil changes. The people that have troubles with these systems are likely lax in the maintenance of the car too.

Skyactiv-G Cylinder Deactivation | Bob Is The Oil Guy

When cylinders are deactivated, the engine uses less fuel, but simply "turning off" the ignition source for the cylinders in question is only one of the operations that has to occur; the valves for...

What Is Hemi MDS?

Cylinder deactivation is used to reduce the fuel consumption and emissions of an internal combustion engine during light-load operation. In typical light-load driving the driver uses only around 30 percent of an engine's maximum power. In these conditions, the throttle valve is nearly closed, and the engine needs to work to draw air.

That's where cylinder deactivation comes in. Cylinder deactivation shuts down a number of the engine's cylinders when they're not needed. That means that when a car or truck is maintaining a constant speed and not accelerating, some cylinders aren't in use. Since they aren't in use, they aren't getting any gas either -- and that saves fuel.

When an engine fitted with cylinder deactivation detects the car is cruising, a solenoid valve opens and a system forces the valves shut, preventing fuel and air from reaching some of the cylinders. This means combustion is only taking place in half of the engine and thus much less fuel is burned when cruising.
