Bhawani Singh, R.K. Goel, in Engineering Rock Mass Classification, 2011. Stability analysis of a rock slope requires assessment of shear strength parameters, that is, cohesion (c) and angle of internal friction of the rock mass. Dilatancy in a rock mass is unconstrained near slopes as normal stress on joints is small due to weight of the wedge.

Rock Slope - an overview | ScienceDirect Topics

Calculating safe slope angle based on c and ϕ values is possible in fresh rock masses such as, perhaps, open pit mines, but in civil engineering excavations, which are often within the weathered zone, it is very difficult to assign a single value to c and ϕ that the designer will be confident will apply to the whole slope.

Slope stability analysis is a static or dynamic, analytical or empirical method to evaluate the stability of earth and rock-fill dams, embankments, excavated slopes, and natural slopes in soil and rock. Slope stability refers to the condition of inclined soil or rock slopes to withstand or undergo movement.The stability condition of slopes is a subject of study and research in soil mechanics ...

Slope stability analysis - Wikipedia

Because the rock mass behind each slope is unique, there are no standard recipes or routine solutions which are guaranteed to produce the right answer each time they are applied. A practical solution is built up from the basic geological data, rock strength information, groundwater observations and a good measure of engineering common sense.

•IN THE DESIGN of rock slopes, the first step is to ascertain the purpose, depth, width, extent, geographic and topographic location, and orientation or azimuth of the cut. These are the engineering requirements of the cut. What is the purpose of the cut? Or in connection with what kind of a project is the cut to be made?

Various rock mass classification systems including rock mass rating (RMR), slope mass rating (SMR) and its extensions, geological strength index, and Q Slope method were used to determine the prevailing stability. Stable slope angle without any reinforcement are suggested for the different probability of failure.
