## **About the Atmospheric Correction Module**

ENVI Atmospheric Correction Module. In the field of image analysis, you need an accurate representation of a land area, whether you're analyzing vegetation, locating an object, or detecting change in an area over time. Deriving accurate results is challenging as most remotely sensed imagery contains "noise" caused by atmospheric particles that can obscure the image and make quantitative analysis unreliable.

amount of water vapor and the distribution of aerosols, both of which affect surface reflectance. Because direct measurements of these atmospheric properties are rarely available, they must be inferred from the image pixels. The ENVI Atmospheric Correction Module provides two atmospheric correction modeling tools for retrieving spectral reflectance from multispectral and hyperspectral images: Quick Atmospheric Correction (QUAC).

## **ENVI ATMOSPHERIC CORRECTION MODULE (ACM)**

ENVI's atmospheric correction module, FLAASH (Fast Line-of-sight Atmospheric Analysis of Spectral Hypercubes), is a first-principles atmospheric correction modeling tool for retrieving spectral reflectance from hyperspectral radiance images. With FLAASH, you can accurately compensate for atmospheric effects.

QUick Atmospheric Correction (QUAC) is an automated atmospheric correction method in ENVI for retrieving spectral reflectance from multispectral and hyperspectral images. QUAC is part of the Atmospheric Correction Module: QUAC and FLAASH and is available for purchase from Harris Geospatial Solutions or your ENVI distributor.

Atmospheric correction is particularly important in those cases where information is going to be extracted primarily based on the spectral properties of the data, and/or adjacent or overlapping scenes acquired under differing conditions are going to be used in conjunction with each other, such as change detection or land cover mapping over a large area using multiple Landsat images.
