Notation. Several notations for the inverse trigonometric functions exist. The most common convention is to name inverse trigonometric functions using an arc- prefix: $\arcsin(x)$, $\arccos(x)$, $\arctan(x)$, etc. (This convention is used throughout this article.) This notation arises from the following geometric relationships: [citation needed] when measuring in radians, an angle of θ radians will ...

The volume of a container is the amount of space it encloses; or how much space is inside of it. For a box, the volume is determined simply by this formula: A box with height H , width W and length L , has volume $V = L \times W \times H$. There are many units that can be used, but due to the way in which this formula is written, the volume would have dimensions of length to the third power.

Then the V will be the product of length, height, and width. So, the volume of the cube formula is: Volume of a Cube = Length \times Width \times Height. $V = a \times a \times a$. $V = a^3$. Where 'a' is the length the side of cube or edges. Derivation for Volume of a Cube. The volume of an object is defined as the amount of space a solid occupies.

Multiply this number by the height to determine the cubic volume in inches. For example, if you have a tank that is 12 inches in diameter and 20 inches high, the calculation looks like this: Divide the cubic volume in inches by 231 in order to find the number of gallons.
