Information theory is a mathematical approach to the study of coding of information along with the quantification, storage, and communication of information. Conditions of Occurrence of Events If we consider an event, there are three conditions of occurrence. If the event has not occurred, there is a condition of uncertainty.

Coding theory is one of the most important and direct applications of information theory. It can be subdivided into source coding theory and channel coding theory. Using a statistical description for data, information theory quantifies the number of bits needed to describe the data, which is the information entropy of the source.

The psychological research I've been exploring lately is called "Dual Coding Theory." It originated with Paivio in the 70s, and explains how visual and linguistic information is processed in two different areas of the brain. In essence, as new input enters the brain, it's stored in short term memory in two distinct categories.
