Human Population And Carrying Capacity

Understanding Carrying Capacity. Human population, now over 7 billion, cannot continue to grow indefinitely. There are limits to the life-sustaining resources earth can provide us. In other words, there is a carrying capacity for human life on our planet. Carrying capacity is the maximum number of a species an environment can support indefinitely.

Carrying Capacity - World Population

Carrying capacity was originally used to determine the number of animals that could graze on a segment of land. The idea has recently been applied to humans in the context of environmentalism. For the human population variables such as sanitation and medical care are sometimes considered as part of the environment. [citation needed]

Carrying capacity - Wikipedia

Sometime over the next millennium -- a relatively short time when you consider the age of the Earth -- the human population's carrying capacity will be realized. Assuming space as the limiting factor, and a population growth rate of 1% (it's currently 1.14%), the population density of Earth will equal one human being per square meter of land in a little over 1,000 years.
