Independent Component Analysis A Tutorial

A Tutorial on Independent Component Analysis. Jonathon Shlens. Google Research Mountain View, CA 94043 (Dated: April 14, 2014; Version 1.0) Independent component analysis (ICA) has become a standard data analysis technique applied to an array of problems in signal processing and machine learning. This tutorial provides an introduction to ICA based on linear algebra formulating an intuition for ICA from first principles.

A Tutorial on Independent Component Analysis

In Independent Component Analysis, Jim Stone presents the essentials of ICA and related techniques (projection pursuit and complexity pursuit) in a tutorial style, using intuitive examples described in simple geometric terms. The treatment fills the need for a basic primer on ICA that can be used by readers of varying levels of mathematical sophistication, including engineers, cognitive scientists, and neuroscientists who need to know the essentials of this evolving method.

The statistical model in Eq. 4 is called independent component analysis, or ICA model. The ICA model is a generative model, which means that it describes how the observed data are generated by a process of mixing the components s_i . The independent components are latent variables, meaning that they cannot be directly observed.

Independent Component Analysis (ICA)

Independent Component Analysis (Herault and Jutten, 1984-1991) • Observed data $x_i(t)$ is modelled using hidden variables $s_i(t)$: $x_i(t) = \sum_{j=1}^m a_{ij}s_j(t)$, $i = 1 \dots n$ (1) or as a matrix decomposition $X = AS$ (2) • Matrix of a_{ij} is constant parameter called "mixing matrix" • Hidden random factors $s_i(t)$ are called "independent components"

(PDF) Independent Component Analysis: an Introduction

Introduction Independent Component Analysis is a signal processing method to separate independent sources linearly mixed in several sensors. For instance, when recording electroencephalograms (EEG) on the scalp, ICA can separate out artifacts embedded in the data (since they are usually independent of each other).

ICA for dummies - Arnaud Delorme

In signal processing, independent component analysis is a computational method for separating a multivariate signal into additive subcomponents. This is done by assuming that the subcomponents are non-Gaussian signals and that they are statistically independent from each other. ICA is a special case of blind source separation. A common example application is the "cocktail party problem" of listening in on one person's speech in a noisy room.
