AGFEO Press Releases

A telephone, or phone, is a telecommunications device that permits two or more users to conduct a conversation when they are too far apart to be heard directly. A telephone converts sound, typically and most efficiently the human voice, into electronic signals suitable for transmission via cables or other transmission media over long distances, and replays such signals simultaneously in ...

a telephone line, it allows transmission of voice and data over copper lines offering more features, higher quality and faster call setup capabilities in comparison to the classic telephone system. VoIP technology and SIP trunking.

SIP trunking. The difference between PSTN, ISDN and VoIP.

ISDN or Integrated Services Digital Network is a circuit-switched telephone network system that transmits both data and voice over a digital line. You can also think of it as a set of communication standards to transmit data, voice, and signaling. These digital lines could be copper lines.

Voice over IP):

Produktbeschreibung: AS 35 All-In-One - AGFEO

† Overhead The ISDN B-channel frames are encapsulated into IP packets for transmission on the packet network. These packets have various headers to support the packet network protocols. Therefore there is always some overhead in addition to the ISDN bandwidth in transporting this data over the packet network.
