1 Introduction. FTDI's Multi-Protocol Synchronous Serial Engine (MPSSE) provides a flexible means of interfacing synchronous serial devices to a USB port. By being "Multi-Protocol", the MPSSE allows communication with many different types of synchronous devices, the most popular being SPI, I2C and JTAG.

The Multi-Protocol Synchronous Serial Engine, or MPSSE, is the heart of the FT232H chip which allows it to speak many different protocols such as I2C, SPI, and more. When the chip is in MPSSE mode it changes the D0to D3pins to have special serial protocol functions: D0- Clock signal output.

Features. PyFtdi currently supports the following features: UART/Serial USB converter, up to 12Mbps (depending on the FTDI device capability) GPIO/Bitbang support, with 8-bit asynchronous, 8-bit synchronous and 8-/16-bit MPSSE variants. SPI master, with simultaneous GPIO support, up to 12 pins per port, with support for non-byte sized transfer.
