Neural networks and deep learning

Deep learning and deep neural networks are a subset of machine learning that relies on artificial neural networks while machine learning relies solely on algorithms. Deep learning and deep neural networks are used in many ways today; things like chatbots that pull from deep resources to answer questions are a great example of deep neural networks.

Neural Networks and Deep Learning Explained

In five courses, you will learn the foundations of Deep Learning, understand how to build neural networks, and learn how to lead successful machine learning projects. You will learn about Convolutional networks, RNNs, LSTM, Adam, Dropout, BatchNorm, Xavier/He initialization, and more.

Neural Networks and Deep Learning | Coursera

More specifically, he created the concept of a "neural network", which is a deep learning algorithm structured similar to the organization of neurons in the brain. Hinton took this approach because the human brain is arguably the most powerful computational engine known today.

Deep Learning Neural Networks Explained in Plain English

This book covers both classical and modern models in deep learning. The chapters of this book span three categories: The basics of neural networks: Many traditional machine learning models can be understood as special cases of neural networks.An emphasis is placed in the first two chapters on understanding the relationship between traditional machine learning and neural networks.
