Phosphoinositides play a major role in cellular signaling and membrane organization. During the last three decades we have learned that enzymes turning over phosphoinositides control vital physiological processes and are involved in the initiation and progression of cancer, inflammation, neurodegenerative, cardiovascular, metabolic disease and more.

Phosphoinositides II: The Diverse Biological Functions ...
Phosphoinositides (PIs) make up only a small fraction of cellular phospholipids, yet they control almost all aspects of a cell's life and death. These lipids gained tremendous research interest as plasma membrane signaling molecules when discovered in the 1970s and 1980s.

Phosphoinositides: Tiny Lipids With Giant Impact on Cell ...
Abstract Phosphatidylinositol lipids generated through the action of phosphinositide 3-kinase (PI3K) are key mediators of a wide array of biological responses. In particular, their role in the regulation of cell migration has been extensively studied and extends to amoeboid as well as mesenchymal migration.

phosphoinositides are also believed to be the source of PLA 2-mediated arachidonate release for the synthesis of prostaglandins and leukotrienes. The amounts of PPIs within cells have been estimated in differentcellsandtissues(1121,1703).Theseestimatesand measurements show significant variations. PtdIns repre-

Phosphoinositides: Tiny Lipids With Giant Impact on Cell ...
Inositol phospholipids have emerged as universal signaling molecules present in virtually every membrane of eukaryotic cells. Phosphoinositides are present in only tiny amounts as compared to structural lipids, but they are metabolically very active as they are produced and degraded by the numerous inositide kinase and phosphatase enzymes.
