Difference from PDH.  
SDH differs from Plesiochronous Digital Hierarchy (PDH) in that the exact rates that are used to transport the data on SONET/SDH are tightly synchronized across the entire network, using atomic clocks. This synchronization system allows entire inter-country networks to operate synchronously, greatly reducing the

amount of buffering required between elements in the network.

## **Synchronous optical networking - Wikipedia**

The basis of Synchronous Digital Hierarchy (SDH) is synchronous multiplexing - data from multiple tributary sources is byte interleaved. In SDH the multiplexed

channels are in fixed locations relative to the framing byte.

zDemultiplexing is achieved by gating out the required bytes from the digital stream.

zThis allows a single channel to be 'dropped' from the data stream without demultiplexing intermediate rates as is required in PDH.

SDH? PDH, abbreviation from plesiochronous digital hierarchy, is a popular technology applied in the networks of telecommunication in order to transport huge amounts of data over digital transport equipment like fibre optic or microwave radio systems. As shown in Figure 1, in PDH, digital multiplexer's inputs are of same bit rate
