A probability distribution is a statistical function that describes all the possible values for a random variable and their associated probabilities. It can be represented using a table or a chart. The probability distribution of a random variable helps us identify which values are most likely and least likely.

Now that we understand how to calculate basic Laplace probabilities, let's get to conditional probabilities. Formally, the probability of A given B (A under the condition of B) is defined as

Probabilities: One Problem, Two Answers. | by Maike Elisa ...

If the odds are 9/4 and you wager \$100, you divide the \$100 by the last number (4) so this would be \$25. Then multiply it by the first number (9), which would come out to \$225 as your profit made from the \$100 you bet. Add the bet you made & the profit made by the bet. So

the final taking would be a total of \$325.

How to Read Odds: 13 Steps (with Pictures) - wikiHow

Odds are simply the way prices and payouts are shown at a horse track. The numbers displayed as 4-7 or 2-5 tell you what you pay and how much you get back if the horse you bet on wins. The first number tells you how much you could win, the second number is the amount you bet. So, if the odds are listed as 2-1, you'll get \$2 for every \$1 you bet.

it's possible to get an estimate of how many events will likely happen in future trials. This is known as the expectation and is denoted by E . If the event is A and the probability of A occurring is $P(A)$, then for N trials, the expectation is: $E = P(A) N$.

How to Find the Probability of an Event and Calculate Odds ...

The odds for the occurrence of an event are simply the probability of occurrence of an event, divided by the probability that the event does not occur.
