Since there are risks attached to such dependency, we speak here about the 'imported urban water risk'. This dependence on external water resources, through both water transfers for urban water supply and food imports for urban food supply, is an inherent and typical concern for water security at the urban level. In addition, the high density of people and economic activities in urban areas concentrates risks.

Urban water security: A review

Both IIGs and EIGs affect the urban water system in terms of water resources availability, risks and resilience or institutional capacity. Impacts cause consequences for particular stakeholders, known as Impact Receivers (IRs). These consequences are described by the indicators and measured by carefully chosen metrics.
